

Requirements Specification — Internal Knowledge Assistant

1. Business Objectives

- Reduce time spent searching internal documentation
- Improve consistency and accuracy of internal knowledge access
- Enable secure use of AI without data leakage risks

2. Stakeholders

Stakeholder	Role
Business Users	Ask questions and consume answers
IT / Engineering	Maintain infrastructure and services
Security Team	Ensure data governance and compliance
Product Owner	Define priorities and success metrics

3. Functional Requirements

ID	Requirement	Priority
FR-01	Users can submit natural-language questions	High
FR-02	System retrieves relevant document content	High
FR-03	System generates answers grounded in retrieved documents	High
FR-04	System displays source citations	High
FR-05	Admin can upload documents for ingestion	Medium
FR-06	System logs queries and response latency	Medium
FR-07	System handles concurrent requests	Medium

4. Non-Functional Requirements

Performance

- p95 response latency < 3 seconds
- Support at least 100 concurrent users (scalable)

Security

- No fine-tuning on proprietary data
- Secure API communication (HTTPS)
- Controlled document access (future)

Scalability

- Horizontal scaling without architectural changes
- Modular service design

Reliability

- Graceful handling of LLM API failures
- Logging and monitoring for observability

5. Out of Scope (MVP)

- Voice interfaces
- External customer access
- Real-time document editing
- Advanced user management and roles

6. Risks & Mitigations

Risk Mitigation	
---- -----	
AI hallucination	Retrieval-augmented generation
Data leakage	No model fine-tuning, access control
High cloud cost	Token limits, caching
Latency spikes	Async processing, optimized retrieval
